Layout Transitions

Aleksander Zubala

@alekzubala

Transitions

Why bother, anyway?

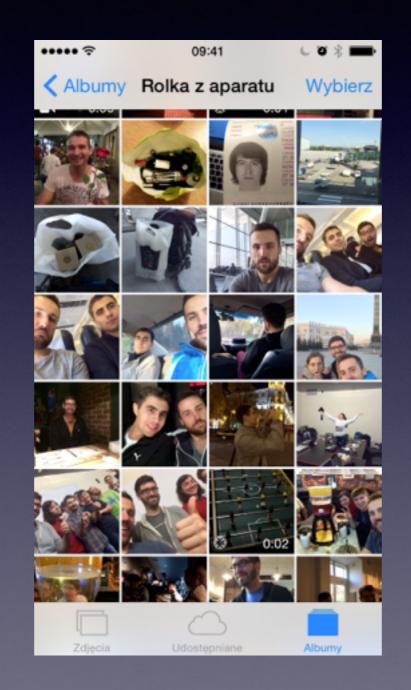

- Change the context (push, modal)
- Change presentation (details)
- Show off:)

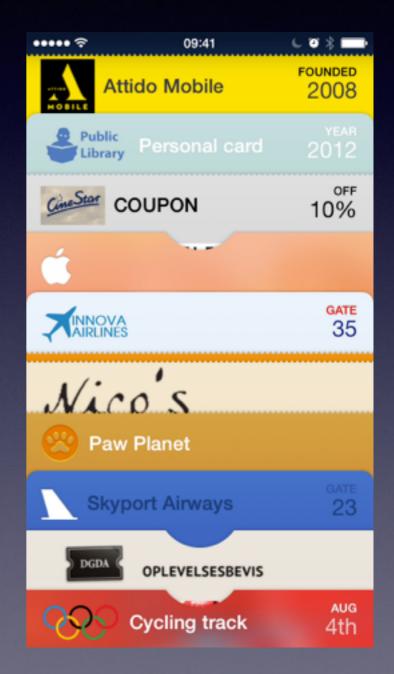

What's good transition?

- not slow, not fast timing
- subtle, balanced between flashy and practical appeal
- presenting main idea clearly staging

Examples

Automatic

- transition between layouts that can be interpolated
- change layout on collection view with setLayout:animated:completion
- non-interactive
- no control over the timing

Automatic

How about we use this info?
 (UICollectionViewLayout.h):

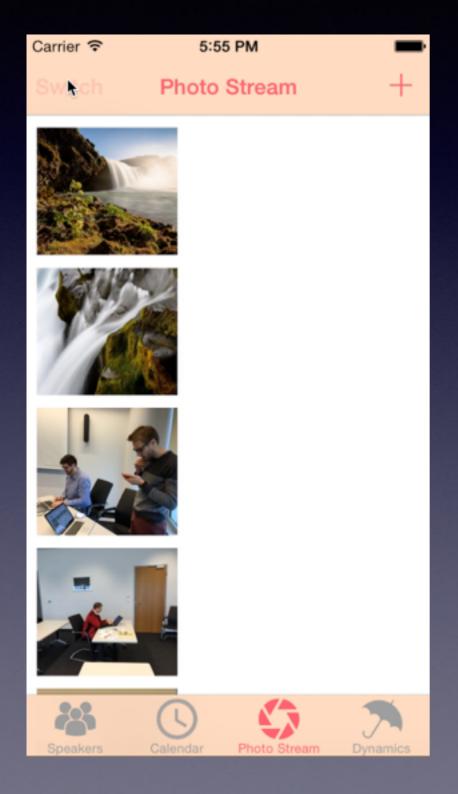

```
animated transition such as a batch update block or an animated bounds
change.
// For each element on screen before the invalidation,
finalLayoutAttributesForDisappearingXXX will be called and an animation
setup from what is on screen to those final attributes.
// For each element on screen after the invalidation,
initialLayoutAttributesForAppearingXXX will be called an an animation setup
from those initial attributes to what ends up on screen.
```

// This set of methods is called when the collection view undergoes an

Task 1: Final/Initial

- git checkout lt-task-1-setup
- Group named Photo Stream
- Key classes:
 - PhotoStreamViewController
 - LeftLayout
 - RightLayout
- Automatic transition (as expected) produces interpolation between left and right layout

Task 1: Final/Initial

TODOs:

- In LeftLayout adjust layout attributes in initial/final methods so items are pushed outside the screen to the left
- The same goes for RightLayout, but push items outside the screen to the right
- git checkout lt-task-1solution

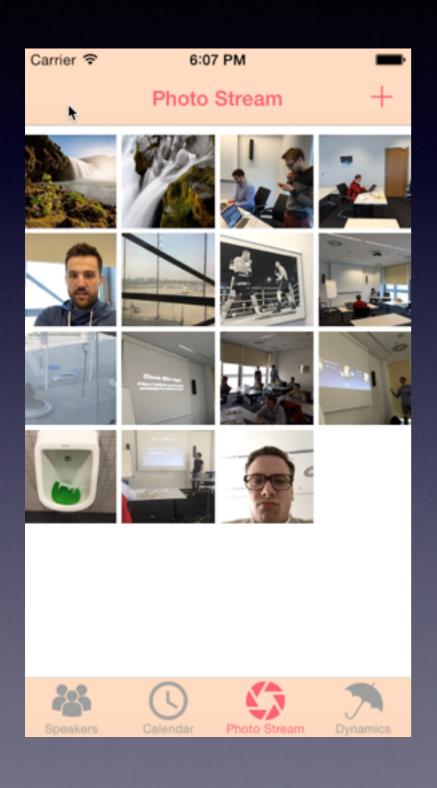

Layout to Layout

- Property on UICollectionViewController called useLayoutToLayoutNavigationTransitions
- Transition using navigation controller
- Collection view controller as the root object
- Perform transition by setting property to YES on controller which will be pushed
- Interactive for free!

Task 2: Layout to Layout

- git checkout lt-task-2-setup
- Group named Photo Stream
- Key classes:
 - PhotoStreamLayout
 - PhotoStreamViewController
 - StreamItemPreviewLayout
 - StreamItemPreviewViewController

Task 2.1: Layout to Layout

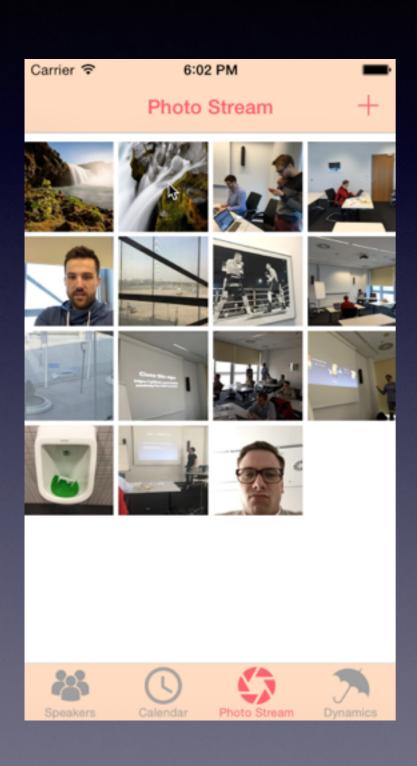

TODO:

- Push (instead of present modal)
 StreamItemPreviewViewController
 when cell is pressed on
 PhotoStreamViewController
- Make sure to set
 useLayoutToLayoutNavigationTransitions to YES
 on StreamItemPreviewViewController
 before pushing onto stack
- git checkout lt-task-2.1-solution

Home Assignment

Task 2.2: Layout to Layout

TODO:

- In StreamItemPreviewLayout set item size to full screen only for selected item, other items should have zero size
- Set alpha to 0 for not selected items
- Use initial/final layout hooks (see Task 1) to control transition
 - PhotoStreamLayout: initial attributes for appearing, should set full screen size for selected item
 - StreamItemPreviewLayout: final attributes for disappearing set grid item size for all items but selected
- Selected index path needs to be tracked in both layouts
- git checkout lt-task-2.2-solution

Task 2: Layout to Layout

- Easy but automatic transition
- Interactive for free
- Presented controller is 'shallow'
 - No delegate
 - No data source
 - Shared collection view

Automatic is boring;)

- So far all transitions automatic
- How about custom stuff?
- Interactive is the new black
- New API from iOS 7 in UICollectionView

startInteractiveTransitionToCollectionViewLayout:completion:

Interactive Transition

- Change the layout using an intermediate transition
- Need to setup gesture or other touch-event handling code
- Update transitionProgress
- To finish: finishInteractiveTransition
- To cancel: cancelInteractiveTransition

Interactive Transition

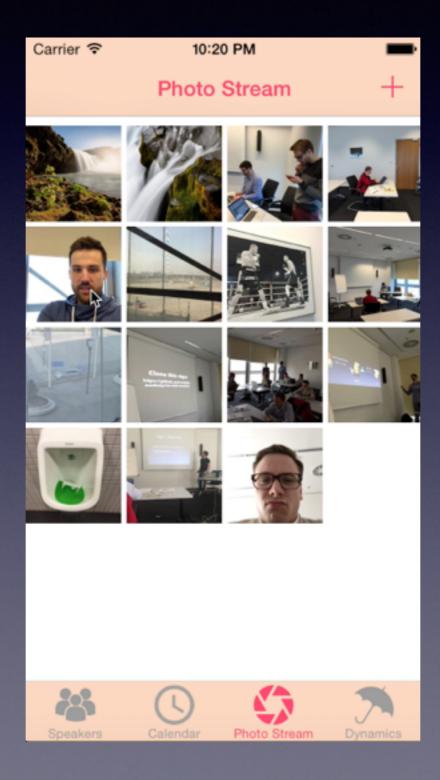

- UICollectionViewTransitionLayout class by default
- Custom transition object instead, implement the

collectionView:transitionLayoutForOldLayout:newLayout:

Task 3: Custom Interactive Transition

- git checkout lt-task-3-setup
- Group named Photo Stream
- Key classes:
 - PhotoStreamViewController

Task 3: Custom Interactive Transition

Task 3.1: Custom Interactive Transition

- Implement pinch callback:
 - Began select index path, start transition
 - Changed update progress, invalidate layout
 - Ended finish transition or cancel depending on the progress
 - Cancelled cancel transition
 - git checkout lt-task-3.1-solution

Task 3.2: Custom Interactive Transition

- Implement collectionView:transitionLayoutForOldLayout:ne wLayout:
- Create subclass of UICollectionViewTransitionLayout
 - layoutAttributesForElementsInRect:
 - layoutAttributesForItemAtIndexPath
- Make use of transitionProgress
- git checkout lt-task-3.2-solution

• It-task-3.2-setup

Where to go next?
